The 2018 collection – New colours and textures

More design options for facades made of glassfibre reinforced concrete

Fitting with current trends and developments, Rieder offers a range of additional processes for the creation of individual building envelopes. The glassfibre reinforced concrete material, fibreC, offers numerous possibilities to print on the panel, illuminate patterns, cut out ornaments or lettering, or incorporate a relief-like surface. In collaboration with planners and architects, two new colour collections and four special textures were developed this year.

New colours and textures

Inspired by the traditional construction method, using wood and brick, the new colour collections of bricky and timber have been created. The use of this colouring for the glassfibre reinforced concrete panels is revolutionary. Warm colours were used during the development, inspired by the magnificent variety of the colours of nature. The timber collection is based on quiet, grounded shades of brown and a wood look. It offers a mix of rustic style with a Scandinavian touch. The bricky collection, in contrast, is colourful and lively. It is based on upbeat, red shades, which are reminiscent of the atmosphere of old brick houses.

The new textures add liveliness and depth to any facade. The various structures create an exciting interplay of light and shadow that changes depending on the angle of view. The four new textures open up additional freedom for architects and room for individual ideas. The different characteristics better emphasise the naturalness of the concrete material and the authentic appearance.

Innovative solutions for inside and outside

Rieder consistently implements the highest environmental standards and “upcycling” plays an important role in the company. Offcuts from the glassfibre reinforced concrete panels are reused and re-processed as small “tiles.” These elements offer countless and individual design possibilities for facades and walls. A further advantage is that less waste is produced and the environment is protected. Another new product is concrete skin breeze. Small gaps in the large glassfibre reinforced concrete panels create a partial view of the surroundings. This results in an interesting interplay between transparency and cladding. Appropriate lighting or solar radiation creates an interesting interaction between light and shade in the direct surroundings. concrete skin breeze can be used in a variety of ways – as a partition, sun protection or design element.
